

## ENVIRONMENTAL POLICY

AD-plast specialises in the injection moulding and finishing of plastic parts, as well as tool manufacture. Continuous optimisation of our production processes means that the impact of our operation on the environment is kept as low as possible. Our mission is to actively work on environmental and quality issues so that we may offer products and services of the right quality at the right time, in full awareness of our duty of care for the environment. For us, statutory requirements and regulations always represent the bare minimum in our work on the environment.

AD-plast is committed to using resource-efficient clean technology wherever economically feasible, to continually improving awareness and knowledge of environmental issues among employees, suppliers and customers, and to preventing pollution.

We endeavour to:

- Work with environmental targets and continuous improvements in relation to the environment.
- Minimise the environmental impact of our operation and prevent pollutants entering the atmosphere, ground and water
- Sort our waste at source and deal with it in a safe and secure manner
- Preserve energy and natural resources through recycling and the streamlining of processes
- Manage and handle chemical products in a safe and secure way and prioritise environmentally friendly alternatives.
- Our staff must feel responsible for the environment and are duty-bound to participate in our environmental work through ongoing information and training.
